

The user starts the program, then types in an input. This input is handled by the main class, which sends it to the current state (initially InitialState). The state then decides what output to generate, which is sent to the main class. The main class then either changes the current state of the program, then sends the input back to the new state, or sends the output to the console, where the user reads it. The user then puts in his next input.
